Econ 491 Problem Set 1

Ramsey EL Lethy

2025-01-29

Question 1 (concept)[30p]

Explain whether each scenario is a classification or regression problem, and indicate whether we are most interested in inference or prediction. Finally, provide n and p.

(a) We collect a set of data on the top 500 firms in the US. For each firm we record profit, number of employees, industry and the CEO salary. We are interested in understanding which factors affect CEO salary.

This is a regression problem, CEO Salary is quantitative

Predictors: Profit, # of Employees, Industry and the CEO salary

N: 500 Firms sampled

We're more interested in inference, we're trying to understand which factors influence CEO salary

(b) We are considering launching a new product and wish to know whether it will be a success or a failure. We collect data on 20 similar products that were previously launched. For each product we have recorded whether it was a success or failure, price charged for the product, marketing budget, competition price, and ten other variables.

This is a Classification problem, The target variable, product launch success is qualitative

Predictors: Price charged for the product, marketing budget, comp price, ten other variables

N: 20 Similar products

We're trying to predict the success or failure of a new product given information about similar products

(c) We are interested in predicting the % change in the USD/Euro exchange rate in relation to the weekly changes in the world stock markets. Hence we collect weekly data for all of 2012. For each week we record the % change in the USD/Euro, the % change in the US market, the % change in the British market, and the % change in the German market.

This is a regression problem, % Change is quantitative

Predictors: % Change in US market, % Change in british market, % Change in German Market

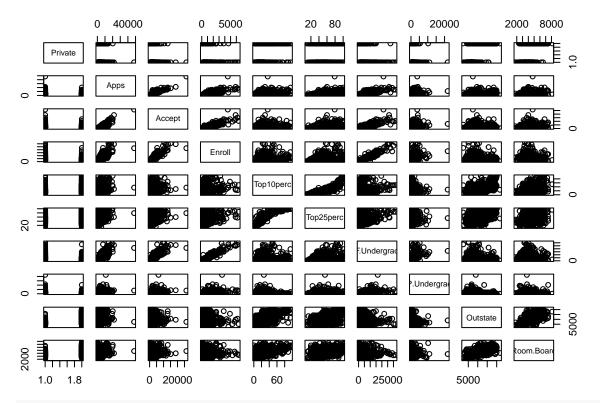

N: 52 samples (1 years worth of weekly data)

We're trying to predict the percent change for a future week based on pased information about the market, so this is a prediciton problem.
